

Presentation Outline & Demo Ops

DeskClaw — Final Presentation Outline

Working outline for the final-term presentation. Companion files:

- `scripts.md` — spoken scripts, slide by slide.
- `slides/` — one self-contained, **full-page** HTML mock per slide (rich layout, not a fixed slide box), for copying layout/visuals into Canva. Open each `.html` in a browser.

Status: **COMPLETE — P1 + P2 + P3 all built** (13 slides + full scripts + demo ops checklist), synced to the final project state (PRs through #39, 97/97 + 14 evals verified). Remaining work is yours: rebuild in Canva from the HTML mocks, record the backup video, assign [P1]/[P2]/[P3], rehearse to time.

Logistics

- 3 presenters, ~15 minutes, live demo** (run on `main`, with a recorded backup).
- This is a **final** presentation: the proposal was already delivered (April 2026), so kept slides are **recapped, not re-explained** — the new job is to show the journey from proposal → delivered.

Presenter split

Block	Presenter	Theme	Time	Slides
A	P1	Why & What (problem + scope decisions)	~4.5 min	P1-01 ... P1-05
B	P2	How it's built & verified (architecture, safety, eval)	~5 min	P2-*
C	P3	See it & where it goes (live demo + future)	~5 min	P3-*

Brand / design tokens (match these in Canva)

Pulled from the proposal deck so the final matches.

Token	Value	Use
Cream (background)	<code>#F3EDD5</code>	Every slide background
Ink (text)	<code>#26241F</code>	Body text, rules, dark pill
Red (primary)	<code>#C62D2C</code>	DESKCLAW wordmark, display headings, accents
Red bright	<code>#FF4B45</code>	Mascot antennae, highlighter marks, "cut" markers
Teal	<code>#16D2C4</code>	Mascot eyes, journey dots, "kept/added" markers
Plum (deep)	<code>#7A1E1A</code>	Source captions, secondary accents, shadows
Display font	Playfair Display , <i>italic</i>	Big headline words (e.g. <i>Conversational Bottleneck</i>)
Label font	Archivo , 800 (uppercase, tracked)	Eyebrow labels (e.g. PROBLEM STATEMENT)
Wordmark font	Archivo , 900	"DESKCLAW"
Body font	Inter , 400/600	Bullets and supporting text

In Canva: Playfair Display ≈ your italic serif; Archivo ≈ the bold label sans (or Helvetica/Arial Bold); Inter ≈ body. Same hex codes throughout.

Extras the full-page mocks add (keep if you like them, drop if not): a faint paper-grain texture, soft drop-shadows on cards, a highlighter swipe behind key words, and a gentle entrance animation. All optional — the core palette/fonts above are what must match.

Real assets available (use instead of mockups where you can)

In `../assets/`: `deskclaw-logo.png` + `deskclaw-logo-full.png` (swap for the mascot placeholder on the title slide), `storefront-catalogue.png`, `storefront-product.png`, `storefront-routines.png`, `admin-dashboard.png`. These are real product screenshots — ideal for P1-03 ("what it is"), the P2 agentic-loop / admin beat, and P3 (skills catalogue + demo backup stills).

Mascot pose set — **GENERATED** (in `assets/`)

One slide-relevant pose of the DeskClaw crab per slide — recurring character, Duolingo-owl style. **All 13 poses are generated and live as `assets/p<slide>.png`** (e.g. `assets/p1-02.png`; `p3-03-alt.png` is an alternate shrug take — pick whichever reads better in Canva). The prompt table below is kept for regeneration.

Placement rules:

- Big mascot on P1-01 / P3-02 / P3-04; **small corner accent** on dense slides (P2-04, P3-01).
- "Animation" = static pose + Canva element animation (rise/pop/wiggle). If one true animation, spend it on the title or the P2-03 alarm-clock beat.
- To regenerate a pose: attach the existing pose (or `docs/assets/deskclaw-logo-full.png`) as the reference image, prompt "this exact character, new pose", and append: `flat vector mascot, red crab with headset, simple shapes, no text, no extra characters, white background`.

Slide	Pose prompt (append the style string)
P1-01	use the real logo as-is
P1-02	overwhelmed crab buried under a pile of chat speech bubbles, sweat drop, frazzled antennae
P1-03	friendly concierge crab, welcoming open claws, holding a small green leaf sprig
P1-04	detective crab examining documents with a magnifying glass
P1-05	tour-guide crab pointing proudly at a wooden signpost with arrows
P2-01	builder crab in a yellow hard hat stacking three labeled blocks
P2-02	guard crab holding a shield, other claw raised in a firm "stop"
P2-03	sleepy-but-working crab at a desk at dawn, coffee cup, typing an email, alarm clock ringing
P2-04	scientist crab in a lab coat holding a clipboard with a big checkmark
P3-01	performer crab juggling ten small colorful icons
P3-02	showman crab in a spotlight, ta-da pose, confetti
P3-03	sincere crab shrugging with one claw open, honest smile
P3-04	crab peeking from the bottom corner, waving one claw

P1 — Why & What (Presenter 1, ~4.5 min)

Goal: set up the problem, say plainly what DeskClaw is, and tell the proposal → delivery evolution story. **No architecture, safety mechanics, or eval** (those are P2).

#	Slide	Kept / New	Purpose	~Time	File
P1-01	Title	Kept (refresh: "Final")	Re-introduce DeskClaw + team	20s	slides/p1-01-title.html
P1-02	Problem — Conversational Bottleneck	Kept (recap)	Why this matters; the social-commerce stats	45s	slides/p1-02-problem.html
P1-03	What DeskClaw is	New	One-line definition + the lifecycle + two surfaces + the proactive-owner teaser	50s	slides/p1-03-what-is-deskclaw.html
P1-04	From proposal to delivery	New	The evolution beat: what changed and why	70s	slides/p1-04-evolution.html
P1-05	What we built (scope)	Adapted (from Objectives)	Capabilities mapped to the journey; hand off to P2	45s	slides/p1-05-scope.html

Adjustment notes for kept slides:

- **P1-01 / P1-02** were shown at proposal. Don't re-teach them — the script does a fast recap and pivots to "...and here's what we actually did about it."
- **P1-05** replaces the proposal's *Objectives* slide: same three pillars (Automated Support / Active Sales / Brand Safety) but reframed as *delivered* capabilities, and honest about the one pillar we deliberately narrowed (margin negotiation → cut).

Skill inventory (authoritative — source for the P3 catalogue)

Two altitudes, on purpose:

- **P1-05 = the journey (evergreen)**. Six stages — Discover · Ask · Buy · Track · Return · Escalate. New skills slot into an existing stage, so this slide **never needs restructuring** as you add features.
- **P3 "All skills" = the full list (living)**. This is the one slide you keep current. Design it as a card grid so adding a skill = adding one card.

DeskClaw now has **two actors**, and the deck should show both:

A. Customer side — the journey on P1-05. 9 customer-facing skills + storefront features:

Stage	Skill(s) / feature	Notes
Discover	search-products , routine-concierge , /routines builder	recommendations; conversational AM/PM routine-builder skill + the deterministic storefront page
Ask	policy-oracle	policy + product-compatibility + routine-ordering, answer-only-from-data
Buy	cart-actions , checkout	add/remove/update cart; mock checkout (no payment)
Track	order-status	read-only, identity-gated
Return	returns-actions	return/exchange request + refund-status read
Escalate	sentiment-router	classify + durable handoff record + emails the owner
Access (cross-cutting)	account-registration , web /login /register /account	create/link account; storefront auth (incl. admin role)

B. Owner / ops side — the agentic, human-in-the-loop layer (PRs #27–#30, 2026-06-10):

Capability	Skill / surface	Notes
Proactive digest	<code>ops-digest</code> skill (<code>npm run ops:digest</code>)	autonomous — scheduled run wakes the agent with no human prompt; read-only store inspection → owner email. The showpiece.
Outbound notify	<code>shop_owner_notify</code> (Resend)	first async outbound channel; owner-only by construction , model-composed body, rate-limited, live/dry. Used by <code>sentiment-router</code> + <code>checkout</code> + <code>ops-digest</code> .
Staff ops panel	<code>web /admin</code> (admin role)	resolve handoffs / advance orders / restock; audited; no money movement . Closes the loop the digest opens.

10 skills total (9 customer-facing + `ops-digest`) · **29 typed MCP tools** · **97 deterministic + 14 model-in-the-loop evals** (verified by running `shop:eval` 2026-06-11; README badges synced in PR #40) · CI green. Channels: terminal chat + **real WhatsApp** (OpenClaw plugin) + web storefront, with a **cross-channel bridge** (PR #35–#37: register in chat → get your account code → log in on the web with the same account; `shop_account_code_get` recovers it). **Project is feature-frozen as of PR #39 — treat as final.**

Persona note for the demo/scripts: to customers the agent is **"Amelya's Concierge"** (warm boutique tone); **"DeskClaw" is the platform name**. Title slide = DeskClaw; live demo, the agent introduces itself as Amelya's.

The project is **feature-frozen for the presentation** — but if anything does land late, the structure absorbs it: customer skills slot into their journey stage on P1-05 (no change) + a card on the P3 catalogue; owner/ops capabilities go in table B and the agentic-loop beat. These two tables are the source of truth.

P2 — How it's built & verified (Presenter 2, ~5 min)

Goal: show that DeskClaw is *safe by design* and *proven*, and reveal the agentic loop. This is the engineering-credibility block.

#	Slide	Purpose	~Time	File
P2-01	Architecture — three layers + MCP boundary	The model never touches the database; everything goes through typed tools. Why a new skill is cheap.	70s	<code>slides/p2-01-architecture.html</code>
P2-02	The safety pipeline	identity → preview → confirm → audit; channel-bound identity; structural guarantees (owner-only email, no autonomous money movement).	70s	<code>slides/p2-02-safety.html</code>
P2-03	The agentic loop (<i>showpiece</i>)	Scheduled run wakes the agent unprompted → reads the store → emails the owner → staff resolves in <code>/admin</code> . Verified live.	80s	<code>slides/p2-03-agentic-loop.html</code>
P2-04	Evaluation — how we know it works	Two-layer harness (deterministic <code>shop:eval</code> 97/97 + 14 model-in-the-loop <code>agent:eval</code>) + GitHub Actions CI + live end-to-end verification.	70s	<code>slides/p2-04-evaluation.html</code>

Notes:

- P2-03 is the *concept/diagram* of the agentic loop; the **live run** of it is the demo climax in P3. Don't double-spend — P2 explains it, P3 shows it.
- Keep P2-01/02 at "how it's safe," not a code tour. The audience needs the *shape* (typed boundary, gated mutations), not the TypeScript.
- The honest caveat to state on P2-03: "proactive" fires only while the machine + gateway are up (local-first, no always-on server).

P3 — See it & where it goes (Presenter 3, ~5 min)

Goal: the payoff. Fast skill catalogue, the live demo as the centerpiece, then an honest close. The demo *shows* what P2 explained — don't re-explain, narrate.

#	Slide	Purpose	~Time	File
P3-01	Ten skills, two sides	The living card grid — 9 customer skills + the owner loop. Narrate fast; the demo proves it.	35s	slides/p3-01-skills-catalogue.html
P3-02	Live demo	Stays on screen <i>during</i> the demo — the 5 beats as a visible path so the audience always knows where we are.	~3.5 min	slides/p3-02-live-demo.html
P3-03	Honest close — limits & where it goes	Fenced-on-purpose vs honest limits vs future.	45s	slides/p3-03-future-work.html
P3-04	Takeaways + Thank You	One-line summary, stats, repo link, mascot.	20s	slides/p3-04-thank-you.html

Demo arc (5 beats)

1. **Register in chat** (`account-registration`) — new customer over WhatsApp/terminal; agent states the account code. *Pre-stage recommended (see below) — show the thread, don't type it live.*
2. **Routine concierge** — one ask ("AM/PM routine for dry skin under NT\$2000") → regimen → bundle into cart, **confirmed per item** (the rails, live).
3. **Checkout** — preview → confirm → order placed (no payment, by design).
4. **Cross-channel bridge** — storefront login with the same account → the order is *there*. One identity, two doors.
5. **Climax: the agent wakes alone** — `npm run ops:digest` → model-composed email lands in the owner's Gmail → log into `/admin` → the dashboard mirrors the digest → resolve the handoff.

Demo ops — checklist & gotchas (the difference between a demo and an incident)

Night before: `git pull + npm run build ; run npm run shop:eval` (expect 97/97); **record the backup video** of the full arc; charge the phone (WhatsApp beat).

30 min before:

- Start `openclaw gateway` ; send one throwaway terminal message to confirm the model answers.
- **`npm run shop:reset`** — critical twice over: it seeds the demo-ready ops state (1 open handoff, 1 order stuck in processing, 2 low-stock products) **and clears notifications , which resets the ops-digest once-per-day dedupe.** If you fired a digest earlier that day without a reset, the live one will silently send nothing.
- Check `.env` : `RESEND_API_KEY` , `OWNER_EMAIL` , `DESKCLAW_NOTIFY_MODE=live` (default is `dry` = records but never sends). Resend's free sender only delivers to the signed-up owner inbox — that's fine, that's the demo.
- Open tabs in order: storefront home · `/login` · owner Gmail · terminal. Phone unlocked on the WhatsApp thread.

Pre-stage beat 1: do the registration over WhatsApp *before* the talk and show the thread on screen ("we registered as a new customer this morning — here's the conversation"). Live registration takes 3–4 model turns and burns a minute of demo time for low drama. Beats 2–5 run live.

Fallback ladder: model slow → talk over it (script has filler lines). Gateway dies → switch to the backup video, same narration. Email doesn't land in ~20s → show the owner's screenshot of the previously delivered live email (exists from the e2e verification) and move on; the `/admin` beat still works because the digest state is in the store.

Persona note: on screen the agent answers as **Amelya's Concierge** ☐ — say once that DeskClaw is the platform, Amelya's is the brand it's serving.
